Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.

Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.
- Replacement costs for employers soar during wartimes

Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.
- Replacement costs for employers soar during wartimes
  - Internal markets: Younger staff are often abscent due to conscription.

Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.
- Replacement costs for employers soar during wartimes
  - Internal markets: Younger staff are often abscent due to conscription.
  - External markets: Shortage of labor supply.

Research Questions

Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.
- Replacement costs for employers soar during wartimes
  - Internal markets: Younger staff are often abscent due to conscription.
  - External markets: Shortage of labor supply.

Research Questions

- How are the vacancies filled by reassinging incumbent workers into different roles through different contracts?

Conscription and Workplace Adjustment: Reallocation, Hiring, and Long-Run Career Effects

- Conflicts and wars displaces workers from their workplaces.
  Japanese bill in 1945 mobilized 65% of the working population into the battlefields.
- Replacement costs for employers soar during wartimes
  - Internal markets: Younger staff are often abscent due to conscription.
  - External markets: Shortage of labor supply.

Research Questions

- How are the vacancies filled by reassinging incumbent workers into different roles through different contracts?
- What are the long run effect of such temporarly reassignment on the career trajectories of the colleagues surrounding the draftee?

Identifying who filled draft-induced vacancies

- We study how draft-induced vacancies in a public-sector organization with more than 40,000 employees (e.g., the Tokyo civil service) were filled.

Identifying who filled draft-induced vacancies

- We study how draft-induced vacancies in a public-sector organization with more than 40,000 employees (e.g., the Tokyo civil service) were filled.
- We compare vacancy-filling patterns across organizationally adjacent sections in response to draft-induced employee exits.

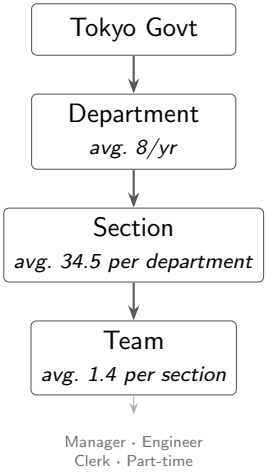

Identifying who filled draft-induced vacancies

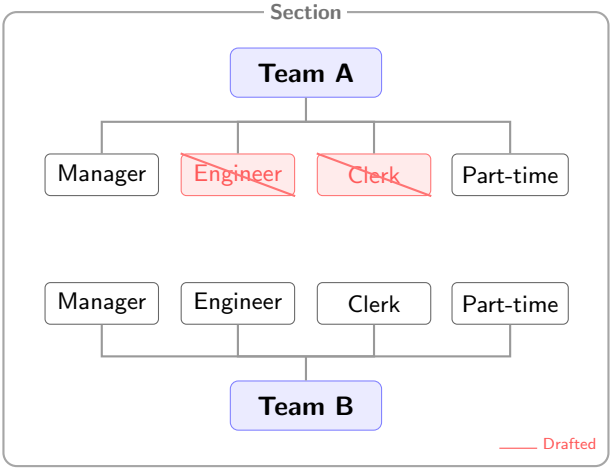

- We study how draft-induced vacancies in a public-sector organization with more than 40,000 employees (e.g., the Tokyo civil service) were filled.
- We compare vacancy-filling patterns across organizationally adjacent sections in response to draft-induced employee exits.
  - The drafting process was undisclosed to the public $\Rightarrow$ drafting is as good as random after conditioning on occupation and section assignment.

Identifying who filled draft-induced vacancies

- We study how draft-induced vacancies in a public-sector organization with more than 40,000 employees (e.g., the Tokyo civil service) were filled.
- We compare vacancy-filling patterns across organizationally adjacent sections in response to draft-induced employee exits.
  - The drafting process was undisclosed to the public $\Rightarrow$ drafting is as good as random after conditioning on occupation and section assignment.
- We compare how vacancies are filled through internal transfers versus external hiring.

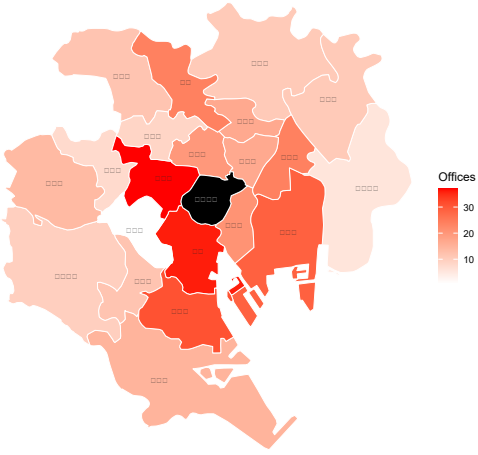

Identification: within-section, within-occupation

Balance test (backup)

Tokyo offices across wards

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

- Y_{okt}: outcome in occupation o, section k, and year t.

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

- Y_{okt}: outcome in occupation o, section k, and year t.
- Draftees_{okt}: number of drafted workers.

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

- Y_{okt}: outcome in occupation o, section k, and year t.
- Draftees_{okt}: number of drafted workers.
- Workers_{kt}: number of workers in section k in year t.

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

- Y_{okt}: outcome in occupation o, section k, and year t.
- Draftees_{okt}: number of drafted workers.
- Workers_{kt}: number of workers in section k in year t.
- α_o: occupation fixed effects.

Empirical strategy: OLS with fixed effects

- For each outcome variable, we estimate:

$$Y_{okt} = \beta \cdot \text{Draftees}_{okt} + \theta \cdot \text{Workers}_{kt} + \alpha_o + \gamma_k + \varepsilon_{okt}$$

- Y_{okt}: outcome in occupation o, section k, and year t.
- Draftees_{okt}: number of drafted workers.
- Workers_{kt}: number of workers in section k in year t.
- α_o: occupation fixed effects.
- γ_k: section fixed effects.

Empirical strategy: who is selected for transfer?

For each donor office unit-year, worker i chooses among transfer outcomes $j \in \{\text{stay}, \text{draft vacancy}, \text{non-draft vacancy}\}$:

$$\Pr(y_{it} = j \mid X_{it}) = \frac{\exp\left(X_{it}'\beta_j\right)}{\sum_{\ell \in \mathcal{J}} \exp\left(X_{it}'\beta_\ell\right)}, \qquad X_{it}'\beta_{\text{stay}} = 0.$$

$$X_{it}'\beta_j = \beta_{0j} + \beta_{1j}\text{Decor}_{i,t-1} + \beta_{2j}\text{Court}_{i,t-1} + \beta_{3j}\text{Female}_{it} + \beta_{4j}\text{Tenure}_{it} + \beta_{5j}\log(\text{Salary}_{i,t-1} + 1) + \lambda_{jt}.$$

- Outcomes are estimated separately for leaving at all, within-kyoku transfers, and cross-kyoku transfers.
- Decoration and CourtRank are coded 0–8, with 0 for unobserved status.
- Female is an indicator, Tenure is years since first observed, and λ_{jt} are outcome-specific year fixed effects.

Drafted workers and replacement margins I

Panel A. Replacement margins					
	Total internal	Same section	Same dept.	Diff. dept.	New hires
No. drafted workers	0.4079***	0.2269***	0.1001**	0.0809***	0.2057**
	(0.0761)	(0.0730)	(0.0403)	(0.0154)	(0.0998)
Panel B. Geographic benchmark for internal replacements					
	Total internal	$\leq$2 km	>2 km	Unknown dist.	New hires
No. drafted workers	0.4079***	0.2506***	0.0780	0.0793	0.2057**
	(0.0761)	(0.0860)	(0.0529)	(0.0642)	(0.0998)
Observations			7,409		
Year FE			Yes		
Section FE			Yes		
Position FE			Yes		
Log cumulative male baseline			Yes		

Notes: OLS regressions. Unit of observation: destination office × kakari × occupation × year, 1938–1945. Each cell reports the coefficient on the number of drafted male workers in the same destination kakari-occupation-year. "Same section" counts workers retained in the same ka group. "Same dept." counts workers from a different ka group within the same normalized kyoku group. "Diff. dept." counts workers from a different normalized kyoku group. "Total internal" is the sum of same section, same department, and different department. Panel B splits the same internal replacements by great-circle distance between prior-year and current-year office ward centroids, using the cached office-ward assignment file in Replacements/MainResults/DescriptiveData. New hires follow Table7_NewHires.R and exclude first observed office-years. All specifications include year, section, and position fixed effects, and control for log cumulative male baseline employment. Standard errors are clustered by office and appear in parentheses. $^{***}p < 0.01$, $^{**}p < 0.05$, $^{*}p < 0.1$.

Bilateral mobility: nested organizational distance

Unit: origin office $\times$ origin occupation $\times$ destination office $\times$ destination occupation $\times$ year.

$$E[F_{op,dq,t}] = \exp\{\beta_1 \log N_{op,t-1} + \beta_2 \log N_{dq,t-1} + \beta_3 \log N_{op,t-1} \log N_{dq,t-1} + \beta_4 \text{OccSimilarity}_{od,t-1} + \beta_5 \mathbf{1}\{\text{same kyoku, diff. ka}\} + \beta_6 \mathbf{1}\{\text{diff. kyoku}\} + \alpha_t +$$

- Retention is same office and same occupation; excluded from the flow panel.
- Baseline category: workers change occupation within the same ka $\times$ kyoku.
- **Same kyoku, different ka**: within-department cross-section mobility.
- **Different kyoku**: cross-department mobility. Sample excludes office-years with drafting at either endpoint.

Bilateral mobility: strong nested distance gradient

Further analysis

- How were promotions and bonus pay used to transfer or retain incumbent workers?
  Findings: Both were used more in impacted offices. Promotions were used more often together with transfers.
- How did early promotion help transferred workers in their subsequent careers?
  Findings:
  1. Transferees sent to drafted offices outperform those sent to non-drafted offices.
  2. Transferees from remote teams perform worse than transferees from neighboring teams.

Discussion and conclusion

- Workplaces compensated for staff losses jointly through internal and external markets (about 2:1 per drafted employee).

Discussion and conclusion

- Workplaces compensated for staff losses jointly through internal and external markets (about 2:1 per drafted employee).
- These results support empirical work on responses to worker exits (Jaeger, Heining, and Lazarus, 2025; the worker-death paper).
  But we show that replacement costs varied with the composition of workers surrounding each affected worker.

Discussion and conclusion

- Workplaces compensated for staff losses jointly through internal and external markets (about 2:1 per drafted employee).
- These results support empirical work on responses to worker exits (Jaeger, Heining, and Lazarus, 2025; the worker-death paper).
  But we show that replacement costs varied with the composition of workers surrounding each affected worker.
- Transferred workers presumably accelerated promotion and contributed to better career trajectories.
