Research question

Did offices that hired more people in response to drafting have more former staff return anywhere in the civil service after the war?

- Unit: 1944 destination office $\times$ team $\times$ position cell.
- Staffing response: internal workers plus external new hires.
- Postwar return: a 1944 draftee reappears in any available Tokyo civil-service directory during 1946–1955.

Empirical design

Equations

$$R_{op} = \beta S_{op} + \gamma B_{op} + \alpha_s + \lambda_p + \varepsilon_{op} \quad \text{(OLS)},$$
$$S_{op} = \pi D_{op} + \gamma B_{op} + \alpha_s + \lambda_p + u_{op} \quad \text{(first stage)},$$
$$R_{op} = \beta \widehat{S}_{op} + \gamma B_{op} + \alpha_s + \lambda_p + \nu_{op} \quad \text{(second stage)}.$$

Exact variable definitions

- **Unit** (o, p)**:** a 1944 office ID $\times$ team (kakari) $\times$ normalized position-title cell.
- R_{op} — **returning workers:** number of men drafted from the cell in 1944 who appear at least once anywhere in the Tokyo civil service in an available 1946–1955 directory; each man counts once.
- S_{op} — **staffing response:** 1944 internal workers plus external new hires. Internal workers are retention in the same section, transfers from another section in the same department, and transfers from another department. A new hire is in his first observed directory year; opening-year office observations are excluded from this category.
- D_{op} — **instrument:** number of male workers in the cell explicitly marked drafted in the 1944 directory.
- B_{op} — **baseline employment:** $\log(1 +$ number of distinct male workers previously observed in the same office ID $\times$ team $\times$ position$)$.
- **Fixed effects:** 1944 section (bureau $\times$ section) and normalized position title. Standard errors are clustered by office ID.

Offices with larger staffing responses had more returnees

	OLS	IV	First stage
Staffing response	0.217***	0.476***	
	(0.038)	(0.067)	
No. drafted workers			0.848***
			(0.087)
Baseline employment control	Yes	Yes	Yes
Section and position FE	Yes	Yes	Yes
Observations	654	654	654
Offices	168	168	168
Cluster-robust first-stage F		94.8	

Notes: The outcome is the number of 1944 draftees from the cell observed anywhere in the postwar Tokyo civil service. Staffing response is internal workers plus new hires. Standard errors, clustered by office, are in parentheses. $^{***}p < 0.01$.

Interpretation: The IV estimate implies that one additional draft-induced staffing response predicts 0.48 additional postwar returnees. Because returnees are drawn from the drafted cohort, draft count may affect returns directly; the exclusion restriction is therefore a substantive limitation.
