Results: Same Section vs. Outside

Outcome: arrivals from the same ka

	(1) OLS	(2) PPML	(3) Occ. pools	(4) Kyoku cl.
Draft × log pool	0.107***	−0.028	0.054	0.107**
	(0.020)	(0.035)	(0.015)	(0.017)
Cells	576	240	576	576
Fixed effects		Kyoku × ka; position		

Outcome: arrivals from outside the own ka

	(1) OLS	(2) PPML	(3) Occ. pools	(4) Kyoku cl.
Draft × log pool	−0.083***	−0.022	−0.006	−0.083*
	(0.024)	(0.015)	(0.022)	(0.012)
Cells	576	558	576	576
Fixed effects		Kyoku × ka; position		

Notes: Separate regressions of each outcome on draft, draft × log own-ka pool, the pool main effect, supply pools at other organizational distances, kyoku × ka FE, and position FE. Pool S contains men in the 1942 ka, at the cell's rank or one below, still employed in 1944, excluding men in the destination cell in 1944. Col. (1): OLS with ka-clustered inference; col. (2): PPML average partial effect; col. (3): occupation-based pools; col. (4): OLS clustered by kyoku. Stars use Webb wild-cluster bootstrap ($B = 9{,}999$), except PPML Wald inference.

Results: Outside Arrivals by Distance, and Total

Outcome: arrivals from other ka in the same kyoku

	(1) OLS	(2) PPML	(3) Occ. pools	(4) Kyoku cl.
Draft × log pool	−0.067**	−0.031**	−0.028	−0.067*
	(0.028)	(0.015)	(0.019)	(0.024)
Cells	576	461	576	576
Fixed effects		Kyoku × ka; position		

Outcome: arrivals from other kyoku

	(1) OLS	(2) PPML	(3) Occ. pools	(4) Kyoku cl.
Draft × log pool	−0.016	−0.007	0.022	−0.016
	(0.013)	(0.005)	(0.010)	(0.016)
Cells	576	432	576	576
Fixed effects		Kyoku × ka; position		

Outcome: total internal arrivals

	(1) OLS	(2) PPML	(3) Occ. pools	(4) Kyoku cl.
Draft × log pool	0.024	−0.037*	0.048	0.024
	(0.036)	(0.020)	(0.025)	(0.019)
Cells	576	558	576	576
Fixed effects		Kyoku × ka; position		

Notes: The empirical model and inference are identical to the preceding table. Outcomes decompose arrivals from outside the own ka into other ka within the same kyoku and other kyoku; total internal arrivals combine all internal source categories.

Balance of internal-transfer sources by pre-draft 1942 stock

Era	Source outcome	Large	Small	Difference	p	N
Peacetime (1934–1937)	Same kyoku, different ka: count	6.93	0.00	6.93	0.190	24
	Different kyoku: count	64.47	47.33	17.13	0.535	24
	Same kyoku, different ka: share	0.036	0.000	0.036*	0.082	23
	Different kyoku: share	0.634	0.838	-0.204	0.129	23
Wartime (1938–1942)	Same kyoku, different ka: count	12.47	0.06	12.41	0.213	35
	Different kyoku: count	105.21	20.94	84.27	0.160	35
	Same kyoku, different ka: share	0.035	0.009	0.026	0.269	35
	Different kyoku: share	0.558	0.521	0.037	0.731	35
Fixed effects	None (era-specific large-stock comparison)					

Notes: Office-year source outcomes are compared between destinations above and below the median 1942 named-worker stock (167.5). Difference is large minus small. Era-specific OLS regressions include a large-stock indicator and cluster standard errors by destination office. Counts are mean arrivals per office-year; shares divide each source count by all office-changing transfers. *N* is the number of office-years. Sample: eight 1944-drafted destination offices observed in 1942 and both eras (four large and four small).
